## Main areas of research

My research interest lies in the field of medical epigenomics and cancer. Using different preclinical models, we are aiming to understand the causality of epigenetic aberrations in cancer, how epigenetic signatures are generated and how they can be reversed and remodeled. We have employed genome-scale analyses to define targets of differential DNA methylation in primary tumors to define epigenetic biomarkers and to discover epigenetic drivers of tumorigenesis. Furthermore, as a main objective of the recently established Ludwig Boltzmann Institute Applied Diagnostics we have developed different organotypic 3D tissue culture models from primary patient material and genetic mouse models, which we use to perform functional molecular analyses and drug testing. I envision that we will be able to generate a living biobank of these models, which can be used for diverse clinical and biological research questions. I believe that epigenetic biomarkers, which are already used for the routine classification of brain tumors, will be highly useful also for other tumor entities and a main goal will be to establish these biomarkers for minimal invasive testing in liquid biopsies.
